                                                                                                                                                                                                                                                                                                                                                                                       
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 239.7<br>-15.8<br>-223.9<br>-14.7<br>-55.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.4<br>-75.2<br>-75.4<br>-75.2<br>-75.4<br>-75.2<br>-75.4<br>-75.2<br>-75.4<br>-75.2<br>-75.4<br>-75.2<br>-75.4<br>-75.2<br>-75.4<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-77.5<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2<br>-75.2 |

Figure 22-3: Undiscounted Cash Flow

Note: Figure courtesy Mantos Copper, 2020

Note: Figure courtesy Mantos Copper, 2020

Item	C1 Cost (US\$/lb)
Cash costs	
Mining	0.70
Process	0.91
G&A	0.09
Freight & Handling	0.10
TC/RC	0.17
Leasing Adjustment	-0.03
Sub-total	1.95
Credits	
By-product credits	-0.24
Deferred stripping credit	-0.15
Total	1.56

Table 22-10: C1 Cash Cost Summary

Notes:

- Gold credits are shown on a 100% basis. Refer to Section 19 for gold price assumptions
- Deferred stripping credit includes production phase capitalized stripping adjustment for 350 Mt for the life of mine and valued at an average US\$ 1.36/t-mined

#### 22.6 Sensitivity Analysis

A sensitivity analysis was performed considering variations in metal prices, operating costs and capital costs.

#### 22.6.1 NPV

The results for NPV sensitivity to these variables are shown in Figure 22-5 and Table 22-11.

Figure 22-5: Sensitivity Analysis, After-tax Incremental NPV, Discounted at 8%

Note: Figure courtesy Mantos Copper, 2020

Change	nange Factor								
in Factor	Commodity Price	Commodity Price Operating Costs							
-30%	88	1,954	1,345						
-20%	497	1,734	1,323						
-10%	893	1,509	1,302						
0%	1,283	1,283	1,283						
10%	1,665	1,050	1,260						
20%	2,045	816	1,238						
30%	2,421	578	1,217						

Table 22-11: Sensitivity Analysis, After-tax Incremental NPV, Discounted at 8%

### 22.6.2 Copper Grade

The grade sensitivity is not explicitly included because for the purposes of the sensitivity analysis Mantos Copper assumed that the sensitivity to changes in copper grades was mirrored by the sensitivity to changes in the copper price.

#### 23 **Adjacent Properties**

This section is not relevant to this Report.

# 24 Other Relevant Data and Information

# 24.1 Project Execution Plan, Mantoverde Development Project Case

The proposed execution plan for the engineering, procurement and construction (EPC) for the new processing facilities required for the MVDP has been awarded to Ausenco Limited, a multi-national engineering, procurement and construction management company. Ausenco has broad experience in the design and construction of copper concentrator projects in the international market. It is expected that Ausenco will use industry-standard practices. The execution plan assumes that Mantos Copper would have an Owner's team working with the contractors during the execution phase.

The main EPC contracts include the following:

- CC01: Earth movement
- EPC01: Process plant and services
- EPC02: Truck shop, infrastructure, shovel yard
- EPC03: Power distribution
- EPC04: Camp, offices and construction warehouses
- EPC05: Tailings dam
- EPC06: Desalination plant.

Mantos Copper personnel will be responsible for work outside the EPC contractors' scope, including environmental permitting, community relations, mine development, fuel and power supply.

The EPC contractors will be responsible for the construction permitting.

#### 24.2 MVDP Schedule

The MVDP schedule is based on the following key milestone dates:

- RCA approved: March 2018
- Start of Project construction: September 2020 Oxide Line, June 2021 Sulphide Line
- EPC01 Process plant and services mechanical completion: June 2023
- EPC06 Desalination plant mechanical completion: June 2023
- EPC05 Tailings dam mechanical completion: May 2023.

#### 24.3 Mantoverde Phase II

Mantos Copper is analyzing an expansion of the concentrator (Phase II), adding a second ball mill and a pebble crusher to increase the concentrator capacity and increasing annual copper production from 2026.

The source of feed for this increased throughput is the already identified mineral inventory as a result of the pit optimization (Table 15-9). The current Mineral Reserves Estimate was constrained by the TSF capacity and therefore the pit shell obtained at a revenue factor of 0.7 was used as a guide for the final pit design. The difference between the pit shell obtained at revenue factor 1.0 and the potential production plan is 204.8 Mt of potential sulphide inventory available for Phase II.

Phase II will require an application for a new environmental permit for the expansion of the TSF. Several options are being assessed at a conceptual level to support a longer LOM. The Mantoverde technical team will also design and develop a Phase II production schedule, maintaining the life of mine at an increased throughput rate.

#### 24.4 Potential Synergies with Santo Domingo Project

Geology: Mineralogy, ore, gangue and contaminants for oxides and sulphides are similar between the Santo Domingo and Mantoverde deposits (Cu, Fe, Au and Co), which favours metallurgical synergies, benchmarking and sharing of good process practices between the two projects.

Mining: Aligning mining equipment type with Mantoverde to share mine equipment, spare parts and maintenance. Use of current Mantoverde Caterpillar 789 trucks for Santo Domingo pre-stripping.

Processing: Santo Domingo oxide resources could be leached on site and the PLS transported to the Mantoverde SX-EW plant (Likelihood: High/Impact: High)

The cobalt plant at Santo Domingo is an upside, the sulphuric acid produced could supply Mantoverde (Likelihood: Low/Impact: High)

Power Supply/Transmission: Combined power purchase contract for three operations (Mantoverde, Santo Domingo and Mantos Blancos) could reduce Opex (Likelihood: Medium/Impact: High)

Desalination Plant: Mantoverde desalination plant could be expanded to provide Santo Domingo water requirements of 350 L/s reducing Capex and simplifying the permitting process. (Likelihood: Medium/Impact: High)

Port: If technically viable, eventually centralize Mantoverde and Santo Domingo to use one port location (Likelihood: High/Impact: High)

Project Execution Plan: Construction camp used by Mantoverde at El Salado could be shared with Santo Domingo with the potential Capex reduction (Likelihood: Medium/Impact: Low)

# 25 Interpretation and Conclusions

The QPs note the following interpretations and conclusions in their respective areas of expertise, based on the review of data available for this Report.

## 25.1 Mineral Resources

- The Mantoverde deposit is an example of an iron oxide-copper-gold (IOCG) deposit.
- The geological setting, style of mineralization and controls on mineralization are known sufficiently to provide useful guides for Mineral Resource estimation.
- Mantoverde has developed internal protocols and controls for data capture and QA/QC protocols and management that allow the use of such data with an adequate level of confidence in the construction of a Resource Model.
- The Mineral Resources were estimated using appropriate data, geological interpretation and estimation methodology that adequately reflect the current understanding of the deposit.
- The Mineral Resources have been classified into Measured, Indicated and Inferred Resource categories based on overall estimation error and production rates.
- The Mineral Resources were constrained within pit shells to establish reasonable prospects for eventual economic extraction.
- Mantoverde Mineral Resources have been estimated in conformity with CIM Estimation of Mineral Resources and Mineral Reserves Best Practice Guidelines (November 2019) and are reported in accordance with 2014 CIM Definition Standards.

#### 25.2 Mineral Processing

- Three metallurgical testwork programs were conducted in support of the planned sulphide operation. The metallurgical testwork performed for the MVDP is sufficient to establish the preferred process route for the mineralization types, and the proposed processing is based on conventional technology. The testwork was performed on representative samples for the purposes of establishing an optimal process flowsheet.
- The metallurgical recoveries from testwork results were used to design the sulphide plant. The recoveries for the current mine plan and economic evaluation were obtained directly from the geometallurgical model estimates that were developed by independent consultant Geoinnova, with support from the Mantos Copper team.
- Geoinnova subsequently updated the Mixed material recoveries for Mantoverde and Manto Ruso/Celso in April 2018, using new metallurgical testwork data collected since the close-out date for data supporting the feasibility study.
- There is a portion of the block model that has had metallurgical recoveries estimated using OK, rather than from the metallurgical recovery formulae. This approach was taken because there was a sector of Mixed/Oxide materials that had insufficient data in the contact zone of the FMV and the Mixed/Oxide zone. This sector had low metallurgical recoveries, and therefore was estimated separately. Although the results are reasonably similar, the geometallurgical model should be updated to reflect the most recent metallurgical recovery assumptions.
- Average LOM recoveries were provided for use in the financial analysis.
- No significant levels of deleterious elements have been reported during the oxide operations or are expected from the treatment of the hypogene material.
- There is upside potential for the Project if a saleable iron concentrate can be generated from magnetite-bearing rocks. Iron content is not currently estimated in the Mineral Resource.

- There is upside potential for recovery of cobalt as a by-product. Detailed studies should be conducted to investigate this opportunity.
- The process flowsheet for treatment of oxide and sulphide materials is simple and based on proven technology.
- Oxide material will continue to be treated via the dynamic leach pad operation or the run-ofmine dump leaching process, these are well-known technologies for Mantoverde.
- Sulphide material will be treated through a conventional process plant using a crush-mill-float process to produce concentrates. The only new technology for Mantoverde is SAG milling which is a well-known technology in Chile.
- Tailings disposal will be conventional using a proven method to construct and raise the sand wall. A detailed water balance has been prepared to design the ancillary equipment to manage the water in the TSF.
- Infrastructure required to support current operations is in place and operational.
- The projected expansion will require some modifications to the existing plant and infrastructure. The following are the main modifications: a new TSF, expansion of the desalination plant and construction of a sulphide process plant.
- The MVDP is a brownfield expansion at an existing oxide operation to incorporate a new copper concentrator and tailings facility. The expansion of the existing plant and infrastructure will not present design challenges. Where expansion or additional facilities are considered, the designs are appropriate and the areas are available in and around the existing facilities.

#### 25.3 Mineral Reserves

- Proven and Probable Mineral Reserves have been identified from Measured and Indicated Mineral Resources. Inferred Mineral Resources have been set to waste. Mineral Reserves are supported by a positive financial analysis.
- Factors that may affect the estimates include: changes to the metal price assumptions; changes to the estimated Mineral Resources used to generate the mine plan; changes in the metallurgical recovery factors; changes in the geotechnical assumptions used to determine the overall wall angles; changes to the operating cut-off assumptions for mill feed or stockpile feed; changes to the input assumptions used to derive the open pit outline and the mine plan that is based on that open pit design; ability to maintain social and environmental licence to operate; and changes to the assumed permitting and regulatory environment under which the mine plan was developed.
- A limiting factor for the Mineral Reserve Estimates and the mine plan is the TSF capacity because the final size of the open pit and the production rate that can be achieved are controlled by the TSF capacity. Upside potential for the Project remains if the tailings constraint can be removed.
- The MVDP will use conventional open pit mining methods and conventional equipment.
- The current mining operation is based on an owner and contractor loading and hauling fleet. The MVDP assumes integration with, and transition from, the current operation to use higher productivity heavy mining equipment to increase the mine capacity. The heavy mining equipment is assumed to be fully owned by Mantoverde when the operation reaches steadystate production.

# 25.4 Risks and Opportunities

The most significant risks evaluated in a risk review were:

- Schedule delays not identified for the MVDP
- Contractor engagement and price uncertainty
- Delay in mine equipment and supplies arrival due to the Covid 19 pandemic
- Increased equipment and labour costs.

The opportunities that were identified include:

- Increase of the concentrator processing capacity, adding an additional ball mill (Phase II) or adding a second line
- Increase the TSF capacity to release reserves restricted by the current TSF capacity
- Enhance recovery through further metallurgical testing
- Additional copper production from mineralized waste dumps
- Share infrastructure with other local companies/projects
- Produce a magnetite concentrate from sulphide tailings
- Recovery of cobalt from sulphide and oxide material
- Additional copper production from brownfield exploration around the property.

Risks and opportunities will be continuously assessed and reviewed throughout the various phases of the Project, in accordance with Mantos Copper's Risk Management Framework.

Mantos Copper considered the following mitigation steps to control the Capex and meet Project deadlines:

Costs

Periodically review the Project progress. At the time of issuing this Report, the costs of the major equipment purchases, pre-stripping and Owner's costs are aligned with the budget. For the EPC lump sum turnkey (LSTK) contract cost, 88% is associated with the contractor's fixed lump sum cost and delivery dates. There are appropriate controls that give confidence that the expected result will be achieved. The remaining 12% of cost is related to the TSF, this could have variations due to construction deviations on site, Mantoverde will hire an expert consultant to mitigate these deviations.

- Schedule
  - The schedule is under control and well advanced
  - The contractor has its own contingencies in the master schedule
  - There are 4 weeks associated with delays due to the Covid-19 pandemic
  - There is a US\$6 M bonus if the ramp-up period is achieved early.

# 26 Recommendations

## 26.1 Mineral Resources

- Improve the geological understanding of gold mineralization and include this knowledge in the resource model to improve the confidence in the estimate.
- Continue the exploration program on surrounding Mantos Copper properties with recognized mineralization potential.
- Continue infill drilling to improve resource categorization and increase confidence of the currently defined Mineral Resources, and provide a better base for long-term mine planning. Table 26-1 shows the drilling costs for the recent years and the budget.

US\$M	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026
Infill	0.8	0.7	4.0		1.9	3.6	4.5	4.0	4.1	4.7
Exploration	1.7	2.2			1.1	1.2	1.5	5.6	5.8	6.1

#### Table 26-1: Drilling Costs

Note: The costs indicated for the period 2022 to 2026 are approved in the budget

## 26.2 Mineral Processing

A review of the Geoinnova data indicates that the rougher recoveries for six of the samples used in the block model were derived from 20 minute rougher recovery results, not the 14 minute rougher recovery results that were the Project design basis. However, the review found that the values were not significantly different and should not impact the Project design criteria. It is recommended that the corrected data be used for the next block model update.

The recovery models for the oxide mineralization are based on metallurgical testwork conducted during pre-feasibility level investigations that were updated with the currently budgeted 5 year recovery expectations. The geometallurgical characteristics of the materials that are planned to be mined and treated through the oxide circuit after the currently budgeted 5 year recovery expectations should be reviewed on an annual basis, as per current practices, and if needed, testwork should be conducted to ensure that the future recoveries are in line with current Mantoverde experience.

Additional metallurgical testwork should be undertaken on the Oxide/Mixed material in the vicinity of the FMV that currently appears to have lower metallurgical recoveries. This will provide additional support for the metallurgical recovery assumptions for such material.

Concentrate filtration tests were undertaken on some of the metallurgical composites using three technologies: vacuum, press and ceramic filters. The results support the current interpretations. Howver, additional filtration tests should be undertaken with filter vendors, assuming the use of press filters.

It is recommended that the mill manufacturers be consulted to confirm that the 250% circulating load assumption is applicable to the final equipment selection.

This work is budgeted at US\$300,000.

## 26.3 Mineral Reserves

The additional conversion of Mineral Resources into Mineral Reserves is constrained by the capacity of the TSF; an increase in size of the TSF will require a modification to the environmental permits. If the TSF capacity can be increased, an increase in Mineral Reserves can be realized by developing

Phase II and maintaining the same life of mine, or by maintaining the throughput rate at 11 Mt per year and extending the life of mine.

It is recommended that autonomous haulage system (AHS) be analyzed as the selected of fleet, this has been used successfully in other mines in Chile. The benefits of AHS are: smaller fleet, less fuel emissions, higher overall productivity (higher utilization and higher speeds) and lower labour requirement.

# 28 Qualified Person Certificates

NCL Ingeniería y Construcción SpA. General del Canto 230, office 401, Providencia, Santiago, Chile. Tel: +56 2 2651-0800 ncl@ncl.cl

# **CERTIFICATE OF QUALIFIED PERSON**

I, Carlos Guzman, Qualified Person for the mineral reserve estimate certify that

I am Principal and Project director at NCL Ingeniería y Construcción SpA, General del Canto 230, office 401, Providencia, Santiago, Chile.

This certificate applies to the Technical Report titled "Capstone Mining Corp, Mantoverde Mine and Mantoverde Development Project, NI-43101 Technical Report, Chañaral/ Región de Atacama, Chile", with an effective date of 29 November 2021.

My qualifications and relevant experiences are that:

- 1. I am a Graduate of the Universidad de Chile and hold a Mining Engineer title (1995).
- I am a practicing Mining Engineer and a Fellow Member of the Australasian Institute of Mining and Metallurgy (FAusIMM, N° 229036); and a Registered Member of the Chilean Mining Commission (RM CMC 0119).
- 3. Have worked as a mining engineer for a total of 26 years. My relevant experience for the purpose of the Technical Report is:
  - Review and report as a consultant on numerous explorations, mining operation and projects around the world for due diligence and regulatory requirements.
  - I have extensive experience in mining engineering. I have worked on mining engineering assignments.
- 4. I have read the definition of Qualified Person set out in Nation Instrument 43-101 (NI 43-101) and certify that by reason of my education, affiliation with a professional association and past relevant work experience, I fulfil the requirements to be a Qualified Person for the purposes of NI 43-101.
- 5. I have visited the Mantoverde site on November 10, 2021. I am responsible for the preparation of sections 1.6, 1.7, 1.10 through 1.15, 2, 3, 15, 16, 19 through 22, 24, 25.3, 25.4, 26.3 and 27 of the Technical Report.
- 6. I am independent of Mantos Copper Holding SpA and Capstone Mining Corp.
- 7. I not have had prior involvement with the property that is the subject of the Technical Report.
- 8. I have read National Instrument 43-101 and the Technical Report has been prepared in compliance with that instrument.
- 9. As of the date of the certificate, to the best of my knowledge, information and belief, the Technical Report Summary contains all material scientific and technical information that is required to be disclosed to make the Technical Report Summary not misleading.

GT Metallurgy Carmencita 130, apt 92 Las Condes, Santiago, Chile. Tel: +56 9 8289-5163 gustavo.tapia@gtmetallurgy.com

# CERTIFICATE OF QUALIFIED PERSON

I, Gustavo Tapia, Qualified Person for the mineral processing and metallurgical recovery, recovery methods and project infrastructure certify that:

I am Independent Process and Metallurgical Consultant at GT Metallurgy, Carmencita 130, apartment 92, Las Condes, Santiago, Chile.

This certificate applies to the Technical Report titled "Capstone Mining Corp, Mantoverde Mine and Mantoverde Development Project, NI-43101 Technical Report, Chañaral/ Región de Atacama, Chile", with an effective date of 29 November 2021.

My qualifications and relevant experiences are that:

- 1. I am a Graduate of the Universidad de Chile and hold a Civil Mining Engineer title (1981).
- 2. I am practicing my profession for 40 years. During this time, I have been directly involved in, and supervised operations, design of metallurgical testwork programs, pilot plant testing, designing process flowsheets, selection of mineral processing equipment and Due Diligence for new projects. I have been directly involved in operations, process engineering design and construction for copper projects in Chile; and a Registered Member of the Chilean Mining Commission (RM CMC 0436).
- 3. Have worked as a mining engineer for a total of 40 years. My relevant experience for the purpose of the Technical Report is:
  - Review and report as an executive of mining companies and independent consultant on numerous mining new business, mining operation and projects around the world for due diligence and regulatory requirements.
  - I have extensive experience in metallurgy and ore processing. I have worked on several metallurgical and ore processing assignments.
  - 4. I have read the definition of Qualified Person set out in Nation Instrument 43-101 (NI 43-101) and certify that by reason of my education, affiliation with a professional association and past relevant work experience, I fulfil the requirements to be a Qualified Person for the purposes of NI 43-101.
  - 5. I have visited the Property on 10<sup>th</sup> November 2021. I am responsible for the preparation of sections 1.4, 1.8, 1.9, 13, 17, 18, 25.2, 26.2 and 27.1 of the Technical Report.
  - 6. I am independent of Mantos Copper Holding SpA and Capstone Mining Corp.
  - 7. I have had earlier involvement with the property as former Executive of the Anglo American Group (2002-2010) but, I not have had prior involvement with the project that is the subject of the Technical Report.
  - 8. I have read National Instrument 43-101 and the Technical Report has been prepared in compliance with that instrument.
  - 9. As of the date of the certificate, to the best of my knowledge, information and belief, the Technical Report contains all material scientific and technical information that is required to be disclosed to make the Technical Report not misleading.

# **CERTIFICATE OF QUALIFIED PERSON**

I, Ronald Turner, state that:

- (a) I am a Senior Resource Geologist at: Golder Associates S.A. Magdalena 181, 3<sup>rd</sup> floor Las Condes, Santiago, Chile
- (b) This certificate applies to the technical report titled "Mantoverde Mine and Mantoverde Development Project NI 43-101 Technical Report Chañaral / Región de Atacama, Chile", with an effective date of: 29th, November 2021 (the "Technical Report").
- (c) I am a "qualified person" for the purposes of National Instrument 43-101 ("NI 43-101"). My qualifications as a qualified person are as follows. I am a graduate of Universidad de Concepción with a Geologist title obtained on 1993 and MAUSIMM CP(Geo). My relevant experience after graduation and over 21 years for the purpose of the Technical Report includes practice as a geologist in the fields of exploration, resource definition and estimation, and open pit mining at various stages of development (green-fields through to established operation) within Chile, Peru, Canada, and the USA. I have worked primarily with copper and gold deposits hosted within various geological environments.
- (d) My most recent personal inspection of each property described in the Technical Report occurred on November 10<sup>th</sup>, 2021 and was for a duration of 01 days.
- (e) I am responsible for Item(s) 1.1 through 1.3, 1.5, 4 through 12, 14, 23, 25.1, 26.1 and 27.1 of the Technical Report.
- (f) I am independent of Capstone Mining Corp.
- (g) I have not had prior involvement with the property that is the subject of the Technical Report.
- (h) I have read NI 43-101, and the part of the Technical Report for which I am responsible has been prepared in compliance with NI 43-101.
- (i) At the effective date of the Technical Report, to the best of my knowledge, information, and belief, the part of the Technical Report for which I am responsible, contain(s) all scientific and technical information that is required to be disclosed to make the Technical Report not misleading.

Dated at Santiago, Chile this 05<sup>th</sup> of January 2022.

CHARTERED PROFESSIONAL GEOLOGY Ronald Turner

Signature of Qualified Person

Ronald Turner, MAusIMM CP(Geo)
